

APIC ProtoHub

Prototyping-as-a-Service for Andhra Pradesh

*Andhra Pradesh has built the machines.
It has not built the way in.*

ProtoHub turns scattered prototyping centres into one bookable network — so idle machines find innovators, and ideas stop dying for lack of access.

4

APIC CENTRES

live in the network today

11

MACHINES

published with full capability specs

6

PROCESSES

FDM · SLA · SLS · CNC · laser · PCB

The gap, and what closes it

WHAT BREAKS TODAY

Zero demand visibility

Machines idle because nobody knows they exist

Manual scheduling & quoting

Registers, WhatsApp, staff memory. Pricing depends on who you ask

Islands, not a network

Kakinada's printer breaks; nobody routes the job to Vijayawada

No utilization data

APIS cannot measure return on crores of capex

ALREADY BUILT AND TESTED

Schema, matcher, and booking flow run against live PostgreSQL 16. Matcher implemented twice — SQL and JavaScript — identical results across six scenarios.

WHAT CLOSES IT

FIT — the capability engine

Users know their part, not our equipment list. Every other feature assumes you already know which machine to book. Fit removes that assumption.

RANK: AVAILABLE → DISTANCE → FIT

Build envelope

Rotation-aware — a 320×330×500 part fits a 340×340×600 machine

Achievable tolerance

Only machines that can actually hold the spec

Live material stock

Never book a machine that will run out mid-job

Availability & distance

Nearest working machine first; small parts spare big ones

Architecture

Next.js · Fastify · PostgreSQL 16 · AWS ap-south-1 (data residency in India)
